Reading with Source Links

A short paper for the Gloss demo

Abstract

Every claim should lead back to its source.

A reader often moves between the text of a paper and its explanation. A source link holds the two together by recording the page and passage behind an observation.

This sample walks through selection, interpretation, and a return to the source. It is an illustration of a reading workflow.

Figure 1. A source-linked reading workflow.

1. Introduction

A note is easier to check when its source is one click away. Linking to the passage preserves the context needed to judge an interpretation.

2. Return to the Source

An anchor records the page and the position of the original passage. With a page and position, a reader can return to the exact place in the document.

2.1. Keep the original in view

First, select a short passage. Read its explanation next to the PDF while the surrounding words are still visible.

2.2. Follow the anchor

Next, follow the anchor back to the passage. The highlight marks where to look, and the rest of the page supplies the context.

Figure 2. Returning to the evidence in context.

3. Discussion

A source link is an invitation to check. It lets a reader compare a short explanation with the full paragraph and decide whether the explanation holds up.

The same pattern works for a section heading, an illustration, or a cited passage. The reader decides when to pause and which detail to check next.

About this sample

This original example was written for the Gloss interactive demo and contains no research results or external paper content.
